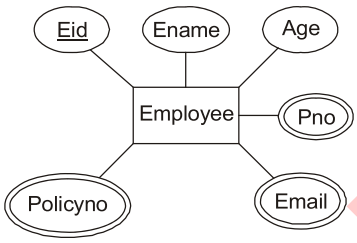
1 Introduction to DBMS and Integrity Constraints and ER Model

Detailed Explanation of Try Yourself Questions

T1 : Solution

(*i*)



Policyno., Email and Pno. are multivalued attributes i.e. each employee may have one or more set of these values.

Hence multivalued attributes are combined with key to make separate tables.

R_1 (Eid, Ename, Age, Eid, Pno., Policyno., Email)

Therefore, 1 table is required.

Hence option (a) is correct answer.

(*ii*) For BCNF the functional dependencies should be such that left side of FD is key.

R_1 (Eid, Ename, Age)

R_2 (Eid, Pno., Policyno., Email)

Eid uniquely determines Ename and Age in R_1

In R_2 there is no redundancy due to functional dependency so it is in BCNF (redudancy due to multivalued functional dependency allowed).

Therefore, 2 table is required.

Hence option (b) is correct answer.

T2 : Solution

(c)

R (A, B, C, D, E)

The given FD's are ABC → DE and D → AB because C → C is a trivial FD so DC → ABC will also be a FD.

∴ DC will be a candidate key and ABC is another candidate key.

The following are the super key's possible listed below.

1. ABCDE
2. ABCD
3. ABC
4. ABCE
5. DC
6. DCA
7. DCB
8. DCAE
9. DCE
10. DCB

∴ 10 super key's are possible.

T3 : Solution

(c)

As per definition of DML (Data Manipulation Language), it is used for selecting, inserting, deleting and updating data in database.

Hence option (c) is true.

T4 : Solution

(c)

Inserting tuples, deleting tuples is work of DML i.e. (Data Manipulation Language).

T5 : Solution

(a)

Views in a database system are inportant because of the following reasons:

(*i*) They help provide data independence.

(*ii*) They help with access control by allowing users to see only a particular subset of the data is databse.

T6 : Solution

The key for R will be AF

∵ A and F individually cannot determine all attributes alone, but AF can determine ABCDEFGH using given FD's.

Alternate

EFG ← H can be removed

∵ F itself can determine G and H, so FG → H is redundant and E is determined by A itself.

So for AF to be key for above FD we don't need EFG → H.

T7 : Solution

(b)

Journal (Volume, Number, Startpage, Endpage, Title, Year, Price)

Primary key: Volume, Number, Startpage, Endpage

FD's: Volume Number Startpage Endpage → Title

Volume number → Year

Volume Number, Startpage Endpage → Price

Given relation 1NF but not 2NF. This DB is redesigned following schemas

R_1(Volume, Number Startpage Endpage Title Price) which has FD's

Volume Number, Startpage Endpage → Title

Volume Number Startpage Endpage → Price

Which is in BCNF.

R_2(Volume, Number, Year)

Volume Number → Year

Which is also in BCNF.

Journal in 1NF

R_1 R_2 in BCNF

Weakest NF which satisfy R_1 and R_2 and fails for journal is 2NF.

■■■■

2 Normalization

Detailed Explanation of Try Yourself Questions

T1 : Solution

(a) R(ABCD), FD = {AB → C, C → D, D → A} are keys: AB, BD, BC

AB → C : AB is a key ⇒ BCNF

C → D : D is key attribute ⇒ 3NF

D → A : A is key attribute ⇒ 3NF

∴ R is in 3NF

(b) R(ABCD), FD = {B → C, B → D} AB is a key

B → C : B is partial dependency.

B → D : B is partial dependency.

∴ R is in 1NF

(c) R(ABCD), FD = {AB → C, BC → D, CD → A, AD → B} keys: AB, BC, CD, AD

∴ All FD's are in BCNF (LHS is a key)

⇒ R is in BCNF

(d) R(ABCD), FD = {A → B, B → C, C → D, D → A} keys A, B, C, D

All FD's are in BCNF

⇒ R is in BCNF

(e) R(ABCDE) {AB → C, DE → C, B → D} key: ABE

AB → C : Partial dependency ⇒ 1NF

DE → C : Transitive dependency ⇒ 2NF

B → D : Partial dependency ⇒ 1NF

∴ R is in 1NF

(f) R(ABCDE): FD = {AB → C, C → D, B → D, D → E} key AB
AB → C : is in BCNF
C → D : Transitive dependency ⇒ 2NF
B → D : Partial dependency ⇒ 1NF
D → E : Transitive dependency ⇒ 2NF
∴ R is in 1NF

(g) R(ABCDE) FD = {A → B, B → C, C → D, D → A} keys = AE, BE, CE, DE
A → B : B is prime attribute
B → C : C is prime attribute
C → D : D is prime attribute
D → A : A is prime attribute
∴ R is in 3NF

T2 : Solution

(a) R(ABCD), FD = {AB → C, C → D, D → A} are keys: AB, DB, CB
AB → C : is in BCNF
C → D : is in 3NF violates BCNF
D → A : is in 3NF violates BCNF
∴ R is in 3NF
BCNF decomposition : {CD, DA, BC}
Not dependency preserving and fails to preserve AB → C dependency

(b) R(ABCD), FD = {B → C, B → D} AB is a key
B → C : is violates 2NF
B → D : is violates 2 NF
2NF decomposition = {B, CD, AB}
3NF decomposition = {BCD, AB}
BCNF decomposition = {BC, BD, AB} and it preserve dependency.

(c) R(ABCD), FD = {AB → C, BC → D, CD → A, AD → B} keys: AB, BC, CD, AD
All FD's are in BCNF
No decomposition is required.

(d) R(ABCD), FD = {A → B, B → C, C → D, D → A} keys A, B, C, D
All FD's are in BCNF
∴ R is in BCNF, hence no decomposition required.

(e) R(ABCDE) FD = {AB → C, DE → C, B → D} key: ABE
AB → C : Violates 2NF (Partial dependency)
DE → C : Violates 3NF (Transitive dependency)
B → D : Violates 2NF
2NF decomposition : {ABC, BD, ABE}
3NF decomposition : ?
Canonical cover of FD = {ABE → C}
3NF decomposition = {ABEC, ABDE}
BCNF decomposition : {ABC, DEC, BD, ABE}

(f) R(ABCDE): FD = {AB → C, C → D, B → D, D → E} key AB

C → D : Violates 3NF

B → D : Violates 2NF

D → E : Violates 3NF

2NF decomposition = {BDE, ABC}

3NF decomposition = ?

Canonical FD = {BE, ABCD}

3NF decomposition = {BE, ABCD}

BCNF decomposition = {CD, BD, DE, ABC}

T3 : Solution

(d)

Normalization is to eliminate redundant data stored in the database.

It reduces the anomalies.

Statement 1 and 3 are correct.

■■■■

3 Relational Algebra, Tuple Relational Calculus and SQL

Detailed Explanation of Try Yourself Questions

T5 : Solution

(a)

$R \cup R = R$ always true (sine union eliminate duplicate)

T6 : Solution

(a)

R(A, B) that has no null values, R has n tuple

Select rr.A, rr.B, ss.A, ss.B

from B as rr, R as ss

where rr.A = ss.A and rr.B = ss.B

Condition follows on output results 'm'

When all tuples are same then maximum n^2 elements are output.

When all tuples are distinct then minimum n elements are present as output.

So, $n \le m \le n * n$

T7 : Solution

(d)

R(A, B) S(A, B)

Elements are not distinct. If m is result of $R \cap S$ then m should follow condition.

Maximum result is min(r, s) when both having same element and size of 1st is less than 2nd or vice versea.

Minimum reslut 0 when no element is comon.

i.e., $0 \le m \le \min(r, s)$

T8 : Solution

(d)

- SQL not permit attribute name to be repeat in same relation.
- SQL query done not eliminate duplicate automatically.
- SQL can work if then is no index on the relation i.e., when relation size is small then no need of index.

T9 : Solution

(c)

Two relations R(A, B) S(A, B) name exact same schema.

1. $R \cap S = R - (R - S)$ true.
2. $R \cap S = S - (S - R)$ true.
3. $R \cap S = R \bowtie S$ ($\bowtie$ on both attribute) so true.
4. $R \cap S = R \times S$ false since $R \times S \supset R \cap S$

So, 1, 2, 3 are correct.

T10 : Solution

(c)

X	Y
1	2
1	2
2	3
3	4
3	4
4	1
4	1
4	1
4	2

X	Y
1	2
1	2
2	3
3	4
3	4
4	1
4	1
4	1
4	2

select $a_1.x$, $a_2.y$, count (*)
from Arc a_1, Arc a_2
where $a_1 . y = a_2 . x$
group by $a_1 . x$, $a_2 . y$

$a_1.x$	a_2y	count
1	3	2
2	4	2
3	2	4
3	1	6
4	2	6

So only (1 3 2) and (3 1 6) are present.

T11 : Solution

(c)

Relation R(a, b) may contain duplicate tupple:

1. select a from R where a = 1 contain duplicate.
2. select Max(b) from R group by a does contain duplicate.
3. select a, b from R group by a, b does not contain duplicate.
4. select a
   from R
   where a not in (select a
   from R)
   result empty always.

T12 : Solution

(c)

Two relations r(R) and S(S). Where R and S are schema of relation.

Then $r \div S$ relation on schema R – S with $S \subseteq R$.

So option 1 and 2 are correct only.

T13 : Solution

(c)

Tuple relational calculus is non-procedural i.e., we know what to retrive but don't know how to retrieve.

- Delarative DML is non-procedural query language.
- SQL is non-procedural query language.
- In procedural query language user instruct the system that what to get and how to get i.e., relational algebra.

So 1 and 4 are true only.

T14 : Solution

(a)

Operation A – B

A and B are union compatible and all rows of A are common to B.

A with 4 column and 20 rows B with 4 column and 15 rows.

The number of rows and column are 0 and 4. Since column will remain but no row will be present i.e.,

A{1, 1, 2, 2, 3} – {1, 2, 3} = {ϕ}

T15 : Solution

(a)

Select A
from T_1, T_2
where $T_1.C = T_2.C$
tuple which pass the selection condition

A	B	C	C	D
1	2	5	5	8
2	4	5	5	8
4	3	5	5	8
1	2	5	5	6
2	4	5	5	6
4	3	5	5	6
1	2	5	5	7
2	4	5	5	7
4	3	5	5	7
1	3	4	4	7
4	8	9	9	7
4	8	9	9	8
3	6	8	8	6
3	7	8	8	6

Now select t_A = {1, 2, 4, 1, 2, 4, 1, 2, 4, 1, 4, 4, 3, 3}
Since no need of distinct element.
So answer is 14.

(b)

$\pi_A(T_1 \bowtie T_2)$

A	B	C	C	D
1	2	5	5	8
2	4	5	5	8
4	3	5	5	8
1	2	4	5	6
2	4	5	5	6
4	3	5	5	6
1	2	4	5	7
2	4	5	5	7
4	3	5	5	7
1	3	4	4	7
4	8	9	9	7
4	8	9	9	8
3	6	8	8	6
3	6	8	8	6

π_A select only distinct value of A. So output is {1, 2, 4, 3}
So answer is 4.
Sum of tuples from both queries = 14 + 4 = 8 and $n_1 > n_2$.

T16 : Solution

1. $\{t \mid \exists p \in R\ (t[A] = p[A])\}$
2. $\{t \mid t \in R \wedge (B = 17)\}$
3. $\{t \mid p \in R\ \exists q \in S\ [t(A) = p(A) \wedge t(A) = p(B) \wedge t(C) = p(C) \cap t(D) = q(D) \wedge t(F) = q(E) \wedge t(F) = q(F)]\}$
4. $\{t \mid \exists p \in R\ \exists q \in S\ [\ t(A) = p(A) \wedge t(B) = p(B) \wedge t(C) = p(C) \wedge t(D) = q(D) \wedge t(E) = q(E) \wedge t(F) = q(F) \wedge P(C) = q(D)] \wedge t(A) = p(A) \wedge t(F) = q(F)\}$

T17 : Solution

(2)

Total

Name	Capacity
Ajmer	20
Bikaner	40
Churu	30
Dungargarth	10

is result of first query.

Total average

Capacity
25

is result of second subquery.

Select name
from Total, Total_Avg
Where total capacity ≥ Total_Avg capcity
Query results two records.

■■■■

4 Transaction and Concurrency Control

Detailed Explanation of Try Yourself Questions

T1 : Solution

$S_1 : r_1(A), r_2(A), r_3(A), w_1(B), w_2(B), w_3(B)$

For the schedule to be view serializable it must satisfy the following conditions: (1) Final Write (2) Initial Read and (3) WR Sequence.

Final Write

For data item A : No write opeations.

For data item B : T_1, T_2, T_3 (order of WRITE operation on data item B)

Therefore $[T_1, T_2] \xrightarrow[\text{before } T_3]{\text{should execute}} T_3$

Initial Read

No write operation on A as well as no read operation on B. Hence this condition do not specify an y order of execution.

WR Sequence

No such sequence. Therefore no condition on order of execution.

$\therefore$ The following are the view equivalent schedules.

$$T_1 \rightarrow T_2 \rightarrow T_3$$
$$T_2 \rightarrow T_1 \rightarrow T_3$$

$S_2 : r_1(A), r_2(A), r_3(A), r_4(A), w_1(B), w_2(B), w_3(B), w_4(B)$

As we can see this schedule is similar to previous schedule and "INITIAL_READ" and "WE-SEQUENCE" do not give any order. The only conditions [T_1, T_2, T_3] should execute before T_4.

$T_1\ T_2\ T_3\ T_4$
$T_1\ T_3\ T_2\ T_4$
$T_2\ T_1\ T_3\ T_4$
$T_2\ T_3\ T_1\ T_4$
$T_3\ T_1\ T_2\ T_4$
$T_3\ T_2\ T_1\ T_4$

S_3 : $r_1(A)$, $r_3(D)$, $w_1(B)$, $r_2(B)$, $w_3(B)$, $r_4(B)$, $w_2(C)$, $r_5(C)$ $w_4(E)$, $r_5(E)$, $w_5(B)$

Final write:

A : No WRITE operation

B : T_1 T_3 T_5 i.e. $[T_1, T_3] \rightarrow T_5$

C : T_2

D : No write operation on D

Initial Read:

A : Only T_1 reads, but no update

B : No initial read operation

C : No initial read operation

D : Only T_3 reads but no update operation

E : No initial read

$\therefore$ No condition on order of execution.

WR Sequence:

A : No updation on A

B : $T_1 \rightarrow T_2$
$T_2 \rightarrow T_3$
$T_3 \rightarrow T_4$

C : $T_2 \rightarrow T_5$

D : No updation D

E : $T_4 \rightarrow T_5$

$\therefore$ Therefore only one serial schedule is view equivalent.

$$T_1 \rightarrow T_2 \rightarrow T_3 \rightarrow T_4 \rightarrow T_5$$

S_4 : $w_1(A)$, $r_2(A)$, $w_3(A)$, $r_4(A)$, $w_5(A)$, $r_6(A)$

Based on WR sequence there is only one serial schedule which is view equivalent.

$$T_1 \rightarrow T_2 \rightarrow T_3 \rightarrow T_4 \rightarrow T_5 \rightarrow T_6$$

S_5 : $r_2(A)$, $r_1(A)$, $w_1(C)$, $r_3(C)$, $w_1(B)$, $r_4(B)$, $w_3(A)$, $r_4(C)$, $w_2(D)$, $r_2(B)$, $w_4(A)$, $w_4(B)$

WR Sequence

B : $T_1 \rightarrow T_4$, $T_1 \rightarrow T_2$

C : $T_1 \rightarrow T_3$

Final Write

A : T_3, T_4 i.e. $T_3 \rightarrow T_4$ (T_3 followed by T_4)

B : T_1, T_4 i.e. $T_1 \rightarrow T_4$

Initial Read

A : T_1, T_2 reads it initially and later updated by T_3 and T_4.
$\therefore$ $(T_1, T_2) \rightarrow (T_3, T_4)$

B : No initial reads

C : No initial reads

D : No initial reads

$\therefore$ Based on the all the above conditions there's only one serial schedule which is view equivalent
i.e. $T_1 \rightarrow T_2 \rightarrow T_3 \rightarrow T_4$

T2 : Solution

T4 : Solution

(a)

T_1	T_2	T_3
$r(a)$		
	$r(b)$	
		$r(c)$
$w(b)$		
	$w(c)$	
		$w(d)$

(i) 
Conflict serial schedules are T_3, T_2, T_1 only 1.

(ii) Number of view equal serial schedules:
$T_2 \rightarrow T_1$ and $T_3 \rightarrow T_1$
So $T_3 \rightarrow T_2 \rightarrow T_1$

(iii)

T_1	T_2	T_3
$s(a)$ $r(a)$		
	$s(b)$ $s(c)$ $r(b)$ unlock (B)	cannot get $X(c)$
		$s(c)$ $X(d)$ $r(c)$ unlock (c)
$X(b)$ $w(b)$ unlock (b) unlock (a)		
	$X(c)$ $w(c)$	No allowed because T_2 is in shrinking phase
		$w(d)$

Schedule is not allowed by 2PL
Not allowed by strict 2PL.

(iv) If $(T_1, T_2, T_3) = (10, 20, 30)$
Set of rollbacks are $(T_1 \rightarrow T_1)$ for W(B) → R(B), $(T_2 \rightarrow T_3)$ for W(c) → R(c).
So transaction T_1 and T_2 are rollback.

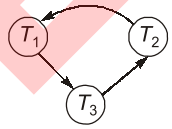
- If $(T_1, T_2, T_3) = (30, 20, 10)$
  No rollback i.e., time-stamp odering is $T_3 \rightarrow T_2 \rightarrow T_1$.
- If $(T_1, T_2, T_3) = (20, 10, 30)$
  Transaction T2 is rollback on C.
- If $(T_1, T_2, T_3) = (30, 10, 20)$
  Transaction T_2 is rollback on C.
- If $(T_1, T_2, T_3) = (20, 30, 10)$
  Transaction T_1 is rollback on B.
- If $(T_1, T_2, T_3) = (10, 30, 20)$

Transaction T_1 is rollback on B.

(b) $r_1(a), r_2(b), r_3(c), w_1(b), w_2(c), w_3(a)$

T_1	T_2	T_3
$r(a)$		
	$r(b)$	
		$r(c)$
$w(b)$		
	$w(c)$	
		$w(a)$

(i) Conflict serializable



Since, there is a cycle in the precedence graph, hence the schedule is not conflict serializable.

(ii) View serializable

For A → $T_1 \rightarrow T_3$
For B → $T_2 \rightarrow T_1$
For C → $T_3 \rightarrow T_2$
Hence, none of the schedule can lead to a view serializable schedule.

(iii) Basic 2PL

T_1	T_2	T_3
$S(a)$		
$r(a)$	$S(b)$	
	$r(b)$	
		$S(c)$
$w(b)$		$r(c)$
	$w(c)$	
		$w(a)$

No basic 2PL possible.

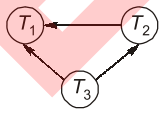
(iv) Strict 2PL

T_1	T_2	T_3
$s(A)$		
$r(A)$		
unlock(A)		
	$s(C)$	
	$r(B)$	
	$S(b)$	
	unlock(b)	
		$S(a)$
		$S(c)$
		$r(c)$
		Unlock(c)
$X(B)$		
$W(B)$		
unlock(b)		
	$X(C)$	
	$W(C)$	
	unlock(c)	
		$X(A)$
		$W(A)$
		unlock(A)

(c) $r_1(A), r_2(B), r_3(C), r_1(b), r_2(C), r_3(d), w_1(C), w_2(D), w_3(E)$

(i) Conflict serializable

T_1	T_2	T_3
$r(A)$		
	$r(B)$	
		$r(C)$
$r(b)$		
	$r(c)$	
		$r(d)$
$w(c)$		
	$w(d)$	
		$w(e)$



$\therefore$ Conflict serializable.

Order $\Rightarrow$ $T_3 \rightarrow T_2 \rightarrow T_1$

(ii) View serializable: $T_3 \rightarrow T_2 \rightarrow T_1$

$\therefore$ Because, on data item 'C' initial read is by T_3 and final write is by T_1. Hence, T_3 should be followed by T_1.

$\therefore$ Because, on data item 'd' initial read is by T_3 and final write is by T_2.

Hence T_3 should be followed by T_2.

(iii) Basic 2PL

T_1	T_2	T_3
$S(a), S(b)$		
$r(a)$		
	$S(b), S(c)$	
	$r(b)$	
		$S(c), S(d), X(e)$
		$r(c)$
$r(b)$		
	$r(c)$	
Not allowed		$r(d)$
$X(c)$		
$w(c)$		
	$w(d)$	
		$w(e)$

$\therefore$ Not allowed under basic 2PL.

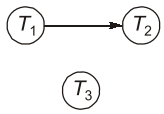
(iv) Strict 2PL:

T_1	T_2	T_3
$S(a), S(b)$ $r(a)$ unlock (a)		
	$S(b), S(c)$ $r(b)$ unlock (b)	
		$S(b), S(d)$ $r(c)$ unlock (c)
$r(b)$ unlock (b)		
	$r(c)$ unlock (c)	
		$r(d)$ unlock (d)
$X(c)$ $w(c)$ unlock (c)		
	$w(d)$ $X(d)$ unlock (d)	
		$w(e)$ $X(e)$ unlock (e)

(d) $r_1(A), r_2(B), r_3(C), r_1(B), r_2(C), r_3(D), w_1(A), w_2(A), w_3(C)$

(i) Conflict serializable

T_1	T_2	T_3
$r(a)$		
	$r(b)$	
		$r(c)$
$r(b)$		
	$r(c)$	
		$r(d)$
$w(a)$		
	$w(a)$	
		$w(c)$



∴ Schedule is conflict-serializable.

(ii) View serializable

Hence only for data item 'a', initial read is done by T_1 and final write is done by T_2. Hence T_1 should be followed by T_2.

For any other data item, there is no such dependency. Hence, the schedule possible under view serializable are: $T_3, T_1, T_2, T_1, T_3, T_2, T_1, T_2, T_3$

(iv) Strict 2PL

T_1	T_2	T_3
$X(a)$		
$r(a)$		
	$S(b)$	
	$r(b)$	
		$S(c),S(d)$
		$r(c)$
		unlock (c)
$S(b)$		
$r(b)$		
unlock (b)		
	$S(c)$	
	$r(c)$	
	unlock (c)	
		$r(d)$
		unlock (d)
$w(a)$		
unlock (b)		
	$X(a)$	
	$w(a)$	
	unlock (a)	
		$X(c)$
		$w(c)$
		unlock (c)

(iii) Basic 2PL

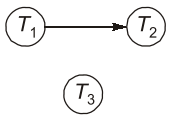
T_1	T_2	T_3
$r(a)$		
	$S(b),S(c)$	
	$r(b)$	
		$S(c),S(d)$
		$r(c)$
$r(b)$		
	$r(c)$	
		$r(d)$
$w(a)$		
unlock (b)		
unlock (a)		
	$X(a)$	
	$w(a)$	
	unlock (a)	
	unlock (b)	
	unlock (c)	
		$X(c)$
		$w(c)$
		unlock (c)
		unlock (d)

$\therefore$ Allowed under basic 2PL.

(e) $r_1(A), r_2(B), r_3(C), r_1(B), r_2(c), r_3(A), w_1(A), w_2(B), w_3(C)$

(i) Conflict serial schedule

T_1	T_2	T_3
$r(a)$		
	$r(b)$	
		$r(c)$
$r(b)$		
	$r(c)$	
		$r(a)$
$w(a)$		
	$w(b)$	
		$w(c)$



∴ Conflict serializable schedule: $T_3, T_1, T_2, T_1, T_3, T_2, T_1, T_2, T_3$

(ii) View serializable

Since the schedule is conflict serializable hence view serializable two.

(iii) Basic 2PL

T_1	T_2	T_3
$X(a),s(b)$		
$r(a)$		
	$S(b),s(c)$	
	$r(b)$	
		$s(c)$
		$r(c)$
$r(b)$		
	$r(c)$	
		$s(a)$ not possible
$w(a)$		$r(a)$
	$w(b)$	
		$w(c)$

∴ Hence, schedule is not possible under basic 2PL.

(iv) Strict 2PL

T_1	T_2	T_3
$s(a),s(b)$		
$r(a)$		
	$s(b),s(c)$	
	$r(b)$	
		$s(c)$
		$r(c)$
$r(b)$		
unlock (b)		
	$r(c)$	
	unlock (c)	
		$s(a)$
		$r(a)$
		unlock (a)
$X(a)$		
$w(a)$		
unlock (a)		
	$X(b)$	
	$w(b)$	
	unlock (b)	
		$X(c)$
		$w(c)$
		unlock (c)

T5 : Solution

(c)

Concurrency control ensures isolation of the transactions.

Recovery management is responsible for Atomicity. Application manager (user) ensures consistency.

T6 : Solution

(c)

Ensuring consistancy for an individual transaction is the responsibility of application programmar.

T7 : Solution

(b)

Every view serializable is not conflict serializable i.e., when schedule is view serializable and there is a write-write conflict then it is not conflict serializable.

T9 : Solution

(c)

Wait-die scheme for deadlock prevention is non-preemptive because when transaction P1 request data item currently held by transaction P2 then P1 is allowed to wait only if it has time-stamp smaller then P2 otherwise P1 is die.

Bound-wait preemptive because when transaction P1 request data item currently held by transaction P2 then P1 is allowed to wait only if it has time-stamp larger then P2 otherwise P1 is rolledback.

So option (2) and (3) is wrong.

T10 : Solution

(c)

Schedule allowed by 2PL may lead to deadlock.

Schedule allowed by 2PL are free from casecading rollback and lost upadate problem.

T11 : Solution

(a)

A schedule allowed by basic time stamp ordering protocol is free from deadlock and not free from cascadeing rollback problem with irrecoverability.

T12 : Solution

(c)

No uncommitted reads so that its casecadeless rollback recoverable because T_1 $w_1(x)$ before T_1 commit / Rollback T_2 $w_2(x)$.

So not strict recoverable.

T_1	T_2
	$r_2(x)$
$r_1(x)$	
	$r_2(y)$
$w_1(x)$	
$r_1(y)$	
	$w_2(x)$
a_1

5 File Structure and Indexing

Detailed Explanation of Try Yourself Questions

T1 : Solution

(a) File size = 10,000

Block size = 1024

Number of entries in 1st level of Dense Index = Number of records in file.

$$\therefore \quad \text{Number of index blocks} = \frac{10000}{\text{Block factor of index block}}$$

$$\text{Block factor of index block} = \frac{1024}{(9+7)} = 64$$

$$\therefore \text{ Number of index 1st level blocks} = \left\lceil \frac{10000}{64} \right\rceil = 157 \text{ blocks}$$

(b) Number of entries in sparse index = Number of blocks in file

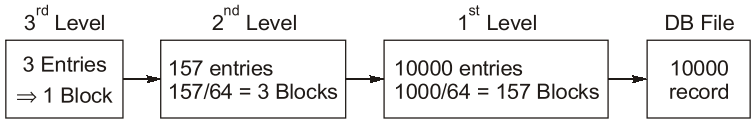
$$\therefore \quad \text{Number of blocks in file} = \frac{10000}{\text{Block factor in file}}$$

$$\text{Block factor} = \frac{1024}{100} = \left\lceil \frac{1024}{100} \right\rceil = 11 \text{ records/block}$$

$$\therefore \quad \text{Number of blocks} = \frac{10000}{11} = 910 \text{ blocks.}$$

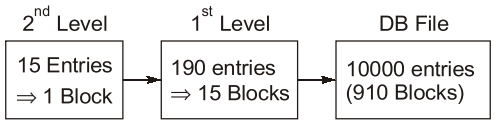
$$\text{Number of index blocks} = \frac{910}{64} = \lceil 14.21 \rceil = 15$$

(c) Number of levels in dense index



∴ Three levels are required.

(d) Number of levels in sparse index



T2 : Solution

(a) File size = 30000 records

Number of entries in 1st level dense index = Number of records in database

$$\text{Index block factor} = \frac{1024}{15} = 69$$

$$\text{Number of 1st level index blocks} = \frac{30000}{69} = 435 \text{ blocks}$$

$$\text{Number of 2nd level index blocks} = \frac{435}{64} = 70 \text{ blocks}$$

Number of 3rd level index blocks = 1 (7 entries only to be entries in index block).

(b) Number of entries in 1st level secondary index = Number of blocks in file

$$\text{Number of blocks in file} = \frac{30000}{\text{Block factor of block}}$$

$$\text{Block factor} = \frac{1024}{100} = 11$$

$$\text{Number of blocks in file} = \frac{30000}{11} = 2728 \text{ blocks}$$

$$\text{Number of bloks in 1st level} = \frac{2728}{\text{Block factor of index block}} = \frac{2728}{69} = \lceil 39.5 \rceil = 40$$

Number of blocks in 2nd level = 1 (only 40 entries per index block and block factor is 69)

(c) 3 levels.

(d) 2 levels.

T3 : Solution

(a) Database file size = 1250 records
Dense index is used
For minimum

Number of index blocks in 1st level = $\frac{1250}{10}$ = 125 blocks

Number of index blocks in 2nd level = $\frac{125}{11}$ = 12 blocks

Number of index blocks in 3rd level = $\frac{12}{11}$ = 2 block needed.

Number of index blocks in 4th level = Only 1 block needed.
∴ By using Dense index minimum 140 index blocks and 4 index levels are required.

(b) **For maximum**

Number of index blocks in 1st level = $\frac{1250}{5}$ = 250 blocks

Number of index blocks in 2nd level = $\frac{250}{6}$ = 42 blocks

Number of index blocks in 3rd level = $\frac{42}{6}$ = 7 block needed.

Number of index blocks in 4th level = $\frac{7}{6}$ = 2 blocks

Number of index blocks in 5th level = Only 1 block needed.
∴ Using Dense index maximum 302 index blocks and 5 index levels are required.

(c) Sparse index and minimum (maximum filling in nodes)

Number of blocks in file = $\frac{1250}{3}$ = 417 blocks

Minimum number of index blocks at 1st level = $\frac{417}{10}$ = 42 (leaf level)

Minimum number of index blocks at 2nd level = $\frac{42}{11}$ = 4

Minimum number of index blocks at 3rd level = Only 1 block is needed and minimum 3 levels are required.

(d) Sparse index and Maximum (minimum filling in nodes)

Number of index blocks in 1st index file = $\frac{417}{5}$ = 84 (leaf levels)

Number of index blocks in 2nd index file = $\frac{84}{6}$ = 14

Number of index blocks in 3rd index file = $\frac{14}{6}$ = 3

Number of index blocks in 4th index file = 1 block

$\therefore$ Using sparse index 102 blocks and 4 levels.

T4 : Solution

(a)

B^+ tree records are stored in premary order. B^+ tree does not use hashing because it's not possible to answer range queries using hashing.

Updations do not cause inbalance in the tree.

T5 : Solution

(c)

The maximum number of new nodes created is "number of levels +1".

In the given case the number of levels are four (including root).

Hence maximum number of new nodes (created are 5)

T6 : Solution

(b)

A data dictionary contains a list of all files in this database, the number of records in each file, and the names and types of each field.

Data database, only book-keeping information for managing it.

T7 : Solution

(a)

B+ tree balanced because the length of the paths from the root to all leaf nodes are all equal and every internal node must filled by.
